

# Edge Cluster Multi-Layer Setup and Configuration

Date: 15 Dec. 2021

## 1. Virtual Machine Setup and Configuration (On-Premise)

- Ubuntu 18.04, one for cloud-core, two for edge-core.
- Open the port of 10000 and 10002 in the security group of the cloud-core machine and edge-core machine
- 16 GB RAM, 16 vCPUs, 128 GB storage.

## 2. Install Kubernetes Tools to Cloud core and Edge core

- Install Kubernetes tools to the virtual machine. (Make sure install version is: 1.21.100).
- [Kubernetes Tools Doc](#)
- Letting iptables see bridged traffic
- Install docker runtime
- Installing kubeadm, kubelet and kubectl

### 2.1. Letting iptables see bridged traffic

- Make sure that the br\_netfilter module is loaded. This can be done by running **lsmod | grep br\_netfilter**. To load it explicitly call **sudo modprobe br\_netfilter**.

```
•  
sudo modprobe br_netfilter  
lsmod | grep br_netfilter  
  
cat <<EOF | sudo tee /etc/modules-load.d/k8s.conf  
br_netfilter  
EOF  
  
cat <<EOF | sudo tee /etc/sysctl.d/k8s.conf  
net.bridge.bridge-nf-call-ip6tables = 1  
net.bridge.bridge-nf-call-iptables = 1  
EOF  
sudo sysctl --system
```

- Verify the bridged

```
lsmod | grep br_netfilter
```

```
root@node-a:~# lsmod | grep br_netfilter
br_netfilter      24576  0
bridge           151552  1 br_netfilter
```

## 2.2. Install docker runtime

- Install Docker runtime

```
sudo apt-get update
```

```
sudo apt-get install docker.io
```

## 2.3. Installing kubeadm, kubelet and kubectl

You will install these packages on all of your machines:

- **kubeadm:** the command to bootstrap the cluster.
  - **kubelet:** the component that runs on all of the machines in your cluster and does things like starting pods and containers.
  - **kubectl:** the command line util to talk to your cluster.
- i. Update the apt package index and install packages needed to use the Kubernetes apt repository:

```
sudo apt-get update
```

```
sudo apt-get install -y apt-transport-https ca-certificates curl
```

Download the Google Cloud public signing key:

```
sudo curl -fsSLo /usr/share/keyrings/kubernetes-archive-keyring.gpg
https://packages.cloud.google.com/apt/doc/apt-key.gpg
```

iii. Add the Kubernetes apt repository:

```
echo "deb [signed-by=/usr/share/keyrings/kubernetes-archive-keyring.gpg]
https://apt.kubernetes.io/ kubernetes-xenial main" | sudo tee
/etc/apt/sources.list.d/kubernetes.list
```

- iv. Update apt package index, install kubelet, kubeadm and kubectl, and pin their version:

```
sudo apt-get update
apt-get install -qy kubelet=1.21.1-00 kubectl=1.21.1-00 kubeadm=1.21.1-00
sudo apt-mark hold kubelet kubeadm kubectl
```

systemctl enable docker.service

```
root@node-a:~# apt-get install -qy kubelet=1.21.1-00 kubectl=1.21.1-00 kubeadm=1.21.1-00

## 2.4. Start a cluster using kubeadm

- (referring doc:  
<https://kubernetes.io/docs/setup/productionenvironment/tools/kubeadm/create-cluster-kubeadm/>)

•

- i. Run command (it might cost a few minutes)

```
kubeadm init
```

•

- ii. At the end of the screen output, you will see info about setting the kubeconfig. Do the following if you are the root user:

```
export KUBECONFIG=/etc/kubernetes/admin.conf
```

•

- iii. Check the cluster is up by running some commands, like

```
kubectl get nodes
```

To start using your cluster, you need to run the following as a regular user:

```
mkdir -p $HOME/.kube
sudo cp -i /etc/kubernetes/admin.conf $HOME/.kube/config
sudo chown $(id -u):$(id -g) $HOME/.kube/config
```

Alternatively, if you are the root user, you can run:

```
export KUBECONFIG=/etc/kubernetes/admin.conf
```

You should now deploy a pod network to the cluster.

Run "kubectl apply -f [podnetwork].yaml" with one of the options listed at:  
<https://kubernetes.io/docs/concepts/cluster-administration/addons/>

Then you can join any number of worker nodes by running the following on each as root:

```
kubeadm join 192.168.4.51:6443 --token xiyzcg38j249ssgebu0at \
--discovery-token-ca-cert-hash sha256:516b2d21660dda7747245f9e283e87532303a67f7e66a2ff18331b52a21322f2
root@node-a:~# export KUBECONFIG=/etc/kubernetes/admin.conf
root@node-a:~# kubectl get nodes
NAME     STATUS    ROLES    AGE   VERSION
node-a   NotReady  control-plane,master  83s   v1.21.1
```

## 3.1. Install GoLang

- You should in root folder (**copy command line should by line by line to run**).

```
GOLANG_VERSION=${GOLANG_VERSION:-"1.14.15"}
sudo apt -y update
sudo apt -y install make
sudo apt -y install gcc
sudo apt -y install id
wget https://dl.google.com/go/go${GOLANG_VERSION}.linux-amd64.tar.gz -P /tmp
sudo tar -C /usr/local -xzf /tmp/go${GOLANG_VERSION}.linux-amd64.tar.gz
```

```
go1.14.15.linux-amd64.tar.gz 100%[=====] 118.38M  2.42MB/s  in 55s
2021-12-15 11:43:15 (2.15 MB/s) - 'go1.14.15.linux-amd64.tar.gz' saved [124135233/124135233]
root@node-a:~# rm -rf /usr/local/go && tar -C /usr/local -xzf go1.14.15.linux-amd64.tar.gz
root@node-a:~# export PATH=$PATH:/usr/local/go/bin
root@node-a:~# go version
go version go1.14.15 linux/amd64
```

ERROR

Nodes were not getting ready in any of the machines (A, B, C)

```
root@node-a:~# kubectl get nodes
NAME      STATUS    ROLES    AGE   VERSION
node-a    NotReady  control-plane,master  36m   v1.21.1
root@node-a:~#
```

```
root@node-b:~# kubectl get nodes
