

Edge Cluster Multi-Layer Setup and Configuration

Date: 27 Dec. 2021

1. Virtual Machine Setup and Configuration (On-Premise)

- Ubuntu 18.04, one for cloud-core, two for edge-core.
- Open the port of 10000 and 10002 in the security group of the cloud-core machine and edge-core machine
- 16 GB RAM, 16 vCPUs, 128 GB storage.

2. Install Kubernetes Tools to Cloud core and Edge core

- Install Kubernetes tools to the virtual machine. (Make sure install version is: 1.21.100).
- [Kubernetes Tools Doc](#)
- Letting iptables see bridged traffic
- Install docker runtime
- Installing kubeadm, kubelet and kubectl

2.1. Letting iptables see bridged traffic

- Make sure that the br_netfilter module is loaded. This can be done by running **lsmod | grep br_netfilter**. To load it explicitly call **sudo modprobe br_netfilter**.

```
sudo modprobe br_netfilter
lsmod | grep br_netfilter
```

```
cat <<EOF | sudo tee /etc/modules-load.d/k8s.conf
br_netfilter
EOF
```

```
cat <<EOF | sudo tee /etc/sysctl.d/k8s.conf
net.bridge.bridge-nf-call-ip6tables = 1
net.bridge.bridge-nf-call-iptables = 1
EOF
sudo sysctl --system
```

- Verify the bridged

```
lsmod | grep br_netfilter
```

```
root@node-a:~# lsmod | grep br_netfilter
br_netfilter      24576  0
bridge            151552  1 br_netfilter
```

2.2. Install docker runtime

- Install Docker runtime

```
sudo apt-get update
```

```
sudo apt-get install docker.io
```

2.3. Installing kubeadm, kubelet and kubectl

You will install these packages on all of your machines:

- **kubeadm**: the command to bootstrap the cluster.
 - **kubelet**: the component that runs on all of the machines in your cluster and does things like starting pods and containers.
 - **kubectl**: the command line util to talk to your cluster.
- i. Update the apt package index and install packages needed to use the Kubernetes apt repository:

```
sudo apt-get update
```

```
sudo apt-get install -y apt-transport-https ca-certificates curl
```

Download the Google Cloud public signing key:

```
sudo curl -fsSLo /usr/share/keyrings/kubernetes-archive-keyring.gpg
https://packages.cloud.google.com/apt/doc/apt-key.gpg
```

- iii. Add the Kubernetes apt repository:

```
echo "deb [signed-by=/usr/share/keyrings/kubernetes-archive-keyring.gpg]
https://apt.kubernetes.io/      kubernetes-xenial      main" | sudo tee
/etc/apt/sources.list.d/kubernetes.list
```

- iv. Update apt package index, install kubelet, kubeadm and kubectl, and pin their version:

```
sudo apt-get update
apt-get install -qy kubelet=1.21.1-00 kubectl=1.21.1-00 kubeadm=1.21.1-00
sudo apt-mark hold kubelet kubeadm kubectl
```

```
systemctl enable docker.service
```

```
root@node-a:~# apt-get install -qy kubelet=1.21.1-00 kubectl=1.21.1-00 kubeadm=1.21.1-00
Reading package lists...

```

2.4. Start a cluster using kubeadm

- (referring doc: <https://kubernetes.io/docs/setup/productionenvironment/tools/kubeadm/create-cluster-kubeadm/>)

- - i. Run command (it might cost a few minutes)

```
kubeadm init
```

- - ii. At the end of the screen output, you will see info about setting the kubeconfig. Do the following if you are the root user:

```
export KUBECONFIG=/etc/kubernetes/admin.conf
```

- - iii. Check the cluster is up by running some commands, like

```
kubectl get nodes
```

To start using your cluster, you need to run the following as a regular user:

```
mkdir -p $HOME/.kube
sudo cp -i /etc/kubernetes/admin.conf $HOME/.kube/config
sudo chown $(id -u):$(id -g) $HOME/.kube/config
```

Alternatively, if you are the root user, you can run:

```
export KUBECONFIG=/etc/kubernetes/admin.conf
```

You should now deploy a pod network to the cluster.

Run "kubectl apply -f [podnetwork].yaml" with one of the options listed at:
<https://kubernetes.io/docs/concepts/cluster-administration/addons/>

Then you can join any number of worker nodes by running the following on each as root:

```
kubeadm join 192.168.4.51:6443 --token xiyecz.g38j249ssgebu0at \
--discovery-token-ca-cert-hash sha256:516b2d21660dda7747245f9e283e87532303a67f7e66a2ff18331b52a21322f2
root@node-a:~# export KUBECONFIG=/etc/kubernetes/admin.conf
root@node-a:~# kubectl get nodes
NAME        STATUS    ROLES    AGE   VERSION
node-a      NotReady control-plane,master 83s   v1.21.1
```

3.1. Install GoLang

- You should in root folder (**copy command line should by line by line to run**).

```
GOLANG_VERSION=${GOLANG_VERSION:-"1.14.15"}
sudo apt -y update
sudo apt -y install make
sudo apt -y install gcc
sudo apt -y install jq
wget https://dl.google.com/go/go${GOLANG_VERSION}.linux-amd64.tar.gz -P /tmp
sudo tar -C /usr/local -xzf /tmp/go${GOLANG_VERSION}.linux-amd64.tar.gz
```

```
go1.14.15.linux-amd64.tar.gz 100%[=====] 118.38M 2.42MB/s in 55s
2021-12-15 11:43:15 (2.15 MB/s) - 'go1.14.15.linux-amd64.tar.gz' saved [124135233/124135233]
root@node-a:~# rm -rf /usr/local/go && tar -C /usr/local -xzf go1.14.15.linux-amd64.tar.gz
root@node-a:~# export PATH=$PATH:/usr/local/go/bin
root@node-a:~# go version
go version go1.14.15 linux/amd64
```

ERROR

Nodes were not getting ready in any of the machines (A, B, C)

```
root@node-a:~# kubectl get nodes
NAME        STATUS    ROLES    AGE   VERSION
node-a      NotReady control-plane,master 36m   v1.21.1
```

```

role.rbac.authorization.k8s.io/weave-net created
rolebinding.rbac.authorization.k8s.io/weave-net created
daemonset.apps/weave-net created
root@node-a:~# kubectl get nodes
NAME      STATUS    ROLES    AGE      VERSION
node-a    NotReady control-plane,master 2m41s     v1.21.1
root@node-a:~# kubectl get nodes
NAME      STATUS    ROLES    AGE      VERSION
node-a    NotReady control-plane,master 2m53s     v1.21.1
root@node-a:~# kubectl get nodes
NAME      STATUS    ROLES    AGE      VERSION
node-a    Ready     control-plane,master 2m54s     v1.21.1

```

- Instal vim

```
sudo apt-get install vim
```

Configuration GoLang Path.

- Open "~/.bashrc" file and add two line to to file end, then save and exit

```
vi ~/.bashrc
```

```

export PATH=$PATH:/usr/local/go/bin
export GOPATH=/usr/local/go/bin
export KUBECONFIG=/etc/kubernetes/admin.conf

```

- run following line and let source file effective. The check version and environment value.

```
source ~/.bashrc
```

```
go version
```

```
go env
```

Setup project location.

- create project folder

```
mkdir -p go/src/github.com
```

- go to project folder

```
cd go/src/github.com
```

- clone fornax repo, change name to Kubeedge, go to "kubeedge" folder, and compile code by "make all"

```
git clone https://github.com/CentaurusInfra/fornax.git
mv fornax kubeedge
cd kubeedge
make all
```

Fornax Configuration

Kubecofig File Preparation

- Copy the admin kubeconfig file of cluster A to machine B, the kubeconfig file of cluster B to the machine of cluster C.
- Copy the kubeconfig files of cluster A, B, and C to the root operator machine.

In machine A, do following

1. Clone a repo of <https://github.com/CentaurusInfra/fornax>, sync to the branch/commit to test. Build the binaries of edgecore and cloudcore using the commands

```
make WHAT=cloudcore
make WHAT=edgecore
```

2. config cloudcore

- notes: following command line only run at first time.

```
mkdir /etc/kubeedge/config -p
```

```
cp /etc/kubernetes/admin.conf /root/.kube/config
```

```
_output/local/bin/cloudcore --minconfig > /etc/kubeedge/config/cloudcore.yaml
```

- **Notes:** if you run above command and meeting error
"/etc/kubeedge/config/cloudcore.yaml: No such file or directory". do following command

```
mkdir /etc/kubeedge/config -p
mkdir /root/.kube/config -p
mkdir -p /etc/kubeedge/ca
mkdir -p /etc/kubeedge/certs
build/tools/certgen.sh genCA IP_A IP_B IP_C
build/tools/certgen.sh genCertAndKey server IP_A IP_B IP_C
```

Then copy the files of folder /etc/kubeedge/ca and /etc/kubeedge/certs in machine A to the folder of /etc/kubeedge/ca and /etc/kubeedge/certs in machine B, and C.

- For first line mostly use "export KUBECONFIG=/etc/kubernetes/admin.conf".

```
export KUBECONFIG=[Cluster_A_kubeconfig_file]
export KUBECONFIG=[Cluster_A_kubeconfig_file]
```

```
kubectl apply -f build/crds/devices/devices_v1alpha2_device.yaml
```

```
kubectl apply -f
build/crds/devices/devices_v1alpha2_devicemodel.yaml
```

```
kubectl apply -f
build/crds/reliablesyncs/cluster_objectsync_v1alpha1.yaml
```

```
kubectl apply -f build/crds/reliablesyncs/objectsync_v1alpha1.yaml
```

```
kubectl apply -f build/crds/router/router_v1_rule.yaml
```

```
kubectl apply -f build/crds/router/router_v1_ruleEndpoint.yaml
```

```
kubectl apply -f build/crds/edgecluster/mission_v1.yaml
```

```
kubectl apply -f build/crds/edgecluster/edgecluster_v1.yaml
```

In machine B, do following

1. Clone a repo of <https://github.com/CentaurusInfra/fornax>, sync to the branch/commit to test. (**See 1.3.3. for detail**) Build the binaries of edgecore and cloudcore using the commands

```
make WHAT=cloudcore
make WHAT=edgecore
```

2. config cloudcore

- notes: following command line only run at first time.

```
mkdir /etc/kubeedge/config -p
```

```
cp /etc/kubernetes/admin.conf /root/.kube/config
```

```
_output/local/bin/cloudcore --minconfig > /etc/kubeedge/config/cloudcore.yaml
```

3. config edgecore

```
cp [Cluster_B_kubeconfig_file] /root/edgecluster.kubeconfig
_output/local/bin/edgecore --edgeclusterconfig > /etc/kubeedge/config/edgecore.yaml
tests/edgecluster/hack/update_edgecore_config.sh [cluster_A_kubeconfig_file]
```

In machine C, do following

1. Clone a repo of <https://github.com/CentaurusInfra/fornax>, sync to the branch/commit to test. (**See 1.3.3. for detail**) Build the binaries of edgecore and cloudcore using the commands

```
make WHAT=cloudcore
make WHAT=edgecore
```

2. config edgecore

- notes: following command line only run at first time.

```
mkdir /etc/kubeedge/config -p
cp [Cluster_C_kubeconfig_file] /root/edgecluster.kubeconfig
_output/local/bin/edgecore --edgeclusterconfig > /etc/kubeedge/config/edgecore.yaml
tests/edgecluster/hack/update_edgecore_config.sh [cluster_B_kubeconfig_file]
```

Run Fornax Cluster in Machine B, C

In machine A.

1. One window run following cloudcore command line (notes: machine A only run cloudcore)(Step 1):

```
export KUBECONFIG=/etc/kubernetes/admin.conf
_output/local/bin/cloudcore
```

```
